Press Release

CAP12 SAIL-BY-WIRE!

African Cats is changing its electrical power distribution system to the revolutionary "SAIL-BY-WIRE" Capi2 digital power system with single nodes to save weight and to improve the performance of her catamarans even more.

We are making this change for the following reasons:

- The weight saving's are over 100 kilo's or lbs.220.
- The number of cables is reduced with more then 60 %.
- We do not need to install cable conduits and gutters.
- There is less space taken up with the whole installation.
- This system is faster and easier to install.
- It is easy to maintain and upgrade.
- The whole electrical system has automatic fuses.
- There is a warning for broken lights and cables.
- Low battery warning lights.
- The appliances are switched off in order of importance with low battery.
- High power consumption warning.
- Backup systems for instruments, bilge pumps and auto pilot.
- Significant lower power consumption.
- All indicator lights are dimmable for night operation.
- The nodes are dimmable for interior and exterior lighting

This way African Cats takes another step that emphasizes the innovational strength of her comfortable lightweight performance leisure catamarans and of her company.
